

Assignment: Careers Page Builder

A. The Assignment

Companies using our ATS want their **Careers page** to match their brand, tell their story, and make it effortless for candidates to discover and apply to open roles — especially on mobile.

You'll build a small product that helps **Recruiters** create branded Careers pages for their company — and lets **Candidates** browse open roles from those pages.

Timeline

You can finish this in **~6–8 focused hours**. The **1-day** window is flexible to let you work at your own pace.

Inspiration

Before you start, explore how some companies tell their story:

1. <https://apply.workable.com/careers/#jobs>
2. <https://apply.workable.com/gbg>
3. <https://jobs.ashbyhq.com/adtucon>

Notice how each page feels **on-brand, simple, and easy to browse** — that's the kind of experience your product should help **Recruiters** build for their companies.

Who Uses It

User	What they do	Page URLs
Recruiter	Logs in, customizes their company's Careers page, and shares it publicly	<code>/login</code> , <code>/company-slug/edit</code> , <code>/company-slug/preview</code>
Candidate	Reads about the company and explores open jobs	<code>/<company-slug>/careers</code>
You (ATS Platform)	Build the system that allows many companies to manage their own Careers pages	—

What You'll Build

Recruiters should be able to:

- Set brand theme (colors, banner, logo, culture video).
- Add, remove, or reorder content sections like *About Us*, *Life at Company*, etc.
- Preview how the page will look before publishing.
- Save settings — each company's data stored separately.
- Share their company's public Careers link.

👉 *Focus on helping recruiters easily build and customize their company Careers page — with clear, usable controls.*

Candidates can:

- Learn about the company through the Careers page.
- Browse open jobs with filters (Location, Job Type) and search by Job Title.
- Experience a clean, mobile-friendly, and accessible UI (labels, contrast, keyboard focus).
- See an SEO-ready page (crawlable HTML, meta tags, structured data).

👉 *You don't need to build the job application flow — just the browsing experience.*

📁 Sample Data

You can use this sample data for your testing.

<https://docs.google.com/spreadsheets/d/16HRj1fHXuq10AxU-RtC6Qd1KBODsqvO4J4v3i1qGcD0/edit?usp=sharing>

📄 Sample Jobs Data

B. What is expected from you? 🤔

✅ Submission Checklist

Keep everything **clear, concise, and easy to follow**.

- **GitHub repo** with working code and sample data
 - **Production live link** (Vercel, Netlify, Render, etc.)
 - **Tech Spec.md** — assumptions, architecture, schema, and test plan. DON'T Write this with AI.
 - **README.md** — how to run, what you built, improvement plan, and step-by-step user guide DON'T Write this with AI.
 - **AGENT_LOG.md** — Short notes on how you used AI tools, e.g., prompts, refinements, and learnings. (DON'T Write this with AI.
 - **Demo video (≤3 min)** — short walkthrough of your app

📁 How to Submit

Once your assignment is complete, please submit your links through the official Whitecarrot submission portal:

 [Open Submission Portal](#)

Enter your **email address**, then fill in the following details:

- **Google Drive Link** – upload a ZIP file of your repository (including working code, sample data, and a clear README with setup steps)
- **Production Live Link** – your deployed app (Vercel, Netlify, Render, etc.)
- **Demo Video Link** – a short walkthrough (≤ 3 minutes)

Double-check that all your links are **publicly accessible** before submitting.

C. Bonus Guidelines

 **Use your imagination** — there's no single “right” answer here. You're free to approach the problem your own way, make assumptions, and design a solution that feels practical, scalable, and delightful to use.

Use **AI tools at every phase** — for brainstorming, UI design, and coding.
Show us *how you worked with AI*, where it helped, and how you improved its output.

Write **clean, maintainable code following best practices** — your next interview will include a short live deep-dive into your code, where you may fix or enhance something.

Focus on delivering a **working, usable prototype** that feels cohesive and complete — something you'd confidently demo to a real customer.

Key Design Questions

- How will you store data for each company separately?
- How can recruiters easily build and customize their page?
- How will edits safely update the page?
- How can candidates browse jobs smoothly?
- How does your design adapt across devices?
- How would you scale if hundreds of companies used it?

Use any stack you prefer. Leverage **design, prototyping, and AI-powered dev tools** to move faster. You can use free-tier platforms like Supabase or Neon.tech for your database.

Final Note

We care more about how you think than how perfect your code is — so take creative risks, experiment, and show us how you'd build in the real world.

Build something you'd proudly demo. Good luck! 🚀

What We'll Evaluate

Category	What We're Looking For
Tech Stack & Design Choices	Why you chose your tools and how they help you move fast while staying maintainable.
Functionality & UX Thinking	Is the app simple, intuitive, consistent, and usable for both Recruiters and Candidates?
Code Quality and Best Practices	Clean components, structured APIs, clear schema, organized folders, design system on frontend, and relevant tests.
AI & Design Tool Usage	How you used AI or design tools to plan, prototype, and code — and how you refined or overruled their output.
Scalability & Next Steps	If this went live, what challenges might appear (performance, UX, or scaling), and how you'd approach them.

D. Questions and Clarifications ?
